

ABSTRACT

The present invention relates to a laundry protector, and more particularly, to a laundry protector having a housing with an interior, an exterior, and a laundry opening therebetween. A lid is attached with the housing and covers the laundry opening while a plurality of washing holes are spaced throughout the housing, passing from the interior to the exterior. The lid of the housing can be opened to expose the laundry opening so that a piece of laundry may be inserted into the interior of the housing through the laundry opening. After closing the lid and enclosing the piece of laundry in the interior of the housing, the laundry protector may be placed within a washing machine, allowing its contents to receive protection while being washed while water and detergent pass through the plurality of washing holes.
